

Gender Pay Gap Report

April 2020

Published October 2021

Introduction

Cordant Cleaning welcomes the opportunity to publish its gender pay gap report, which has been taken from the pay details of the colleagues we paid in the pay period within which the 5 April 2020 fell (referred to under the relevant regulations as the “snapshot date”).

The business was acquired in March 2020 via a trade and asset purchase and had only traded for one month prior to the snapshot date. As such, the bonus data was limited and therefore should be treated with caution as a valid measure.

A total of 2,816 colleagues were paid within the relevant pay period, of which 36.7% were female, and 63.3% were male.

We have a greater proportion of male colleagues as our services are concentrated in the transport / bus cleaning sector, which has traditionally been and remains a male dominated sector of the labour market.

Notwithstanding the challenges this will present in being able to deliver change to our gender pay gaps in the near term, as we develop our people strategies and integrate them into our future business plans we will take into account our gender pay gap data, ensuring diversity and inclusion remain a key focus area for the future.

I confirm the information and data reported within this report and submitted via the Government Equalities Office gender pay gap reporting service is accurate as of the snapshot date 5 April 2020.

Stuart Tolson
Senior HR Business Partner

Understanding our gender pay gap report

How is the gender pay gap measured?

There are four key measures:

- Mean hourly pay and bonus pay gap
- Median hourly pay and bonus pay gap
- Proportion of males / females that received a bonus in the 12 month period ending on the snapshot date
- Proportion of males / females in each quartile pay band

How is the mean hourly pay gap calculated?

The mean pay gap is expressed as a percentage and shows the difference in the average hourly rate of pay between male and female colleagues. This is calculated by adding up the hourly rates of pay for all females, and dividing this by the number of females, and doing the same calculation for males. The percentage is then calculated by taking the average hourly rate for all females from the average hourly rate for all males, and multiplying the result by 100.

How is the median hourly pay gap calculated?

Firstly, you rank all female employees in order of their hourly pay rate (highest to lowest). You then find the hourly rate of pay belonging to the female that is in the middle of the list. If there is an odd number of female colleagues in the list the middle person will be easy to find e.g. if 105 females then we use the hourly pay rate for the female ranked at number 53. If there is an even number of female colleagues, then you find the middle two records and calculate the average hourly rate of the two e.g. if 110 employees, you calculate the average hourly rate of pay for the female colleagues ranked 55 and 56 in the list.

The same calculation is undertaken for male colleagues, with the median hourly pay gap expressed as a percentage by taking the median hourly pay rate for females from the median hourly pay rate for males and multiplying by 100.

How is the mean and median bonus pay gap calculated?

In the same way as the mean and median hourly pay gaps are calculated (see above), but instead looking at the differences in the mean and median values in relation to the amount of bonus paid in the 12 month period ending on the snapshot date to male and female colleagues.

Understanding our gender pay gap report

What do the percentage pay gaps actually mean?

They effectively show how much more male colleagues earn in comparison to females in relation to average hourly rates of pay and average annual bonus payments, or vice versa.

If the percentage gap is shown as a positive number it means, on average, our male colleagues have a higher rate of pay and / or level of bonus payments than females. If the percentage gap is shown as a negative number, it means, on average, our female colleagues have a higher rate of pay and / or level of bonus pay than their male colleagues.

Important Note

The gender pay gaps look at comparing the pay data for all male and female colleagues regardless of their job role, so is not the same as equal pay and should not be considered to be an indication that an employer is breaching equal pay rights, which focus on whether male and female colleagues receive the same rate of pay for doing the same or broadly similar job role.

What are the quartile pay bands?

This is calculated by ranking all colleagues, regardless of their gender, from the highest hourly pay rate in the organisation to lowest hourly pay rate.

This list is then divided into four quarters, with as equal number of employees in each quartile as possible.

The report then shows the proportion of males and females in each of the following pay quartiles:

- Upper
- Upper middle
- Lower middle
- Lower

Our results for 2020

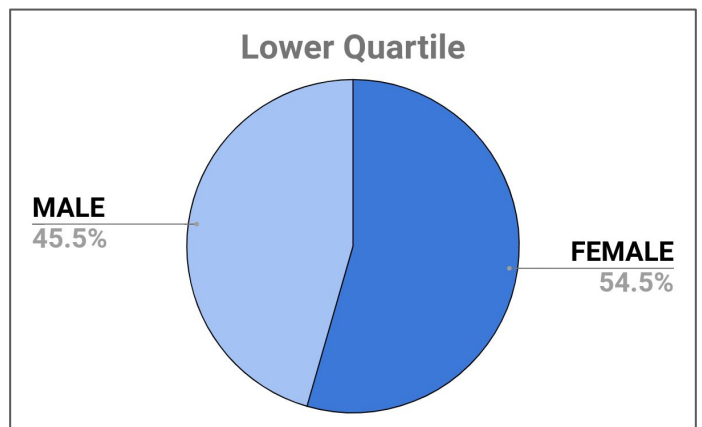

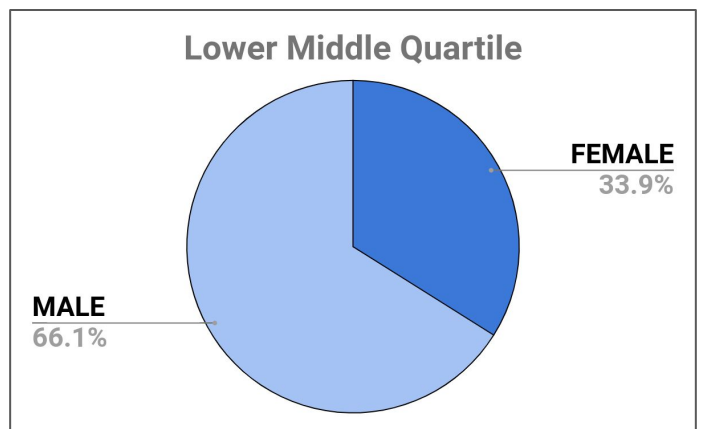

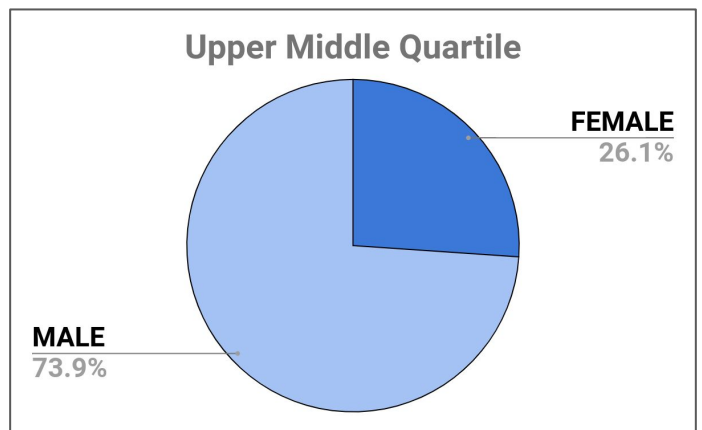

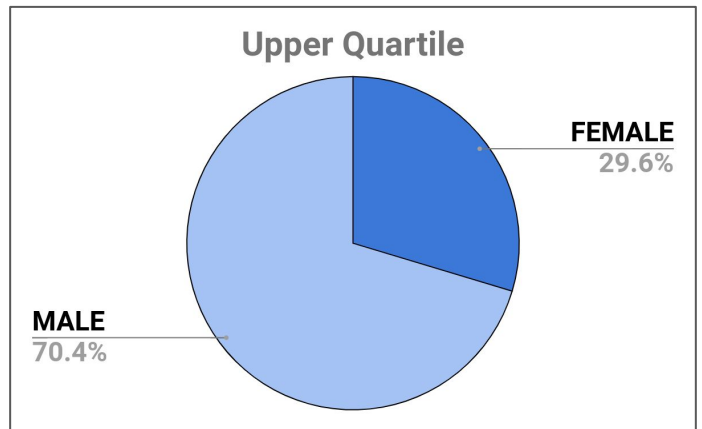

As outlined in the introduction, our results will be influenced by:

- the larger male population we have within our business / sector;
- the bonus data being limited to one month so should be treated with caution

The mean bonus gap is also influenced by one male senior executive within a small number (26) employees that received a bonus within the reportable data.

Only 0.8% of male colleagues received a bonus against 1.1% of female colleagues

The charts to the right show the proportion of female and male colleagues within each of the four pay quartile bands.

Measure	% Gap
Mean hourly pay gap	6.4%
Median hourly pay gap	13.5%
Mean bonus pay gap	77.5%
Median bonus pay gap	-50%
